

SOC Home Lab

Part 1 – Building Windows 11 Victim Endpoint

Author: Denzel Corson

Date: June 30, 2026

Technologies Used

- **Oracle VirtualBox**
- **Windows 11**
- **Microsoft Sysmon (Next Lab)SwiftonSecurity(Next Lab)**

OBJECTIVE:

The objective of this lab is to configure enhanced endpoint logging on a Windows 11 virtual machine. By installing Microsoft Sysmon with the SwiftonSecurity Sysmon configuration, the Windows endpoint will generate detailed security logs beyond what Windows Event Logs provide by default.

Lab Setup

A Windows 11 virtual machine was created using Oracle VirtualBox to simulate a victim endpoint. This system will be used throughout future labs to generate Windows security events, execute simulated attacks, and validate detection capabilities.

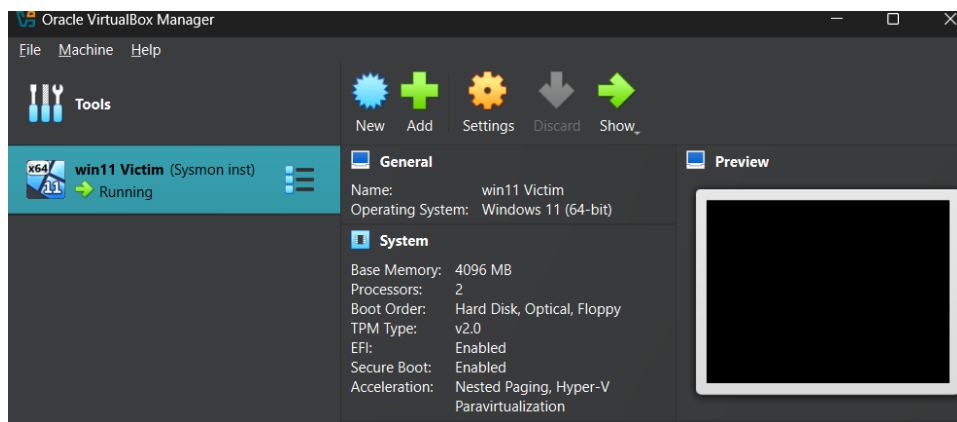

Figure 1. Windows 11 victim virtual machine created in Oracle VirtualBox. This VM serves as the endpoint used throughout the SOC lab environment.

Install Sysmon on Windows 11 victim machine to generate detailed alerts on endpoints that Windows Event Logs do not provide alone.

Skills Demonstrated

- Oracle VirtualBox
- Windows 11 Virtual Machine Deployment
- Lab Environment Preparation
- Endpoint Virtualization

Key Takeaways

- Successfully created a dedicated Windows 11 endpoint for future SOC investigations.
- Established an isolated lab environment that can safely simulate attacks.
- Prepared the victim machine for enhanced endpoint monitoring using Sysmon.

Future Labs

Next Steps

- Install Microsoft Sysmon
- Configure SwiftonSecurity Sysmon rules
- verify endpoint telemetry
